### Cell Cycle Phases

The cell cycle is a series of events that lead to the production of two daughter cells from a single parent cell. It is divided into four main phases: G<sub>1</sub>, S, G<sub>2</sub>, and M.

**G<sub>1</sub> Phase:** The first phase of the cell cycle, where the cell grows and prepares for DNA replication.

**S Phase:** The second phase, where DNA is replicated, resulting in two identical copies of the parent DNA molecule.

**G<sub>2</sub> Phase:** The third phase, where the cell continues to grow and prepares for the final division.

**M Phase:** The final phase, where the cell divides into two daughter cells through the process of mitosis.

The cell cycle is a continuous process that ensures the growth and reproduction of cells.
